Water meets AI

In the view of **Infinite Water Inc.**, the management of water resources depends on understanding, communicating, and measuring the value of water and incorporating it into decision-making by applying **AI** to problems relating to water to ensure good development outcomes. **Infinite Water Inc.** is a storehouse of water related knowledge and has read, time and again, that every year 3.6 million people worldwide die from waterborne illnesses, with children accounting for around 2.2 million fatalities. This is a primary concern for **Infinite Water Inc.** and should be for all those that are not directly affected. It is a natural progression for **Infinite Complex** to embrace the latest advances in **AI** and apply them to every facet of **Infinite Water Inc.** to improve water related living conditions worldwide.

It is the intent of **Infinite Complex** to utilize **AI** in all situations to manage waterborne infections and drinking water. The goal of **Infinite Complex** is to grow the ability of an **AI** system to learn, adapt, and gradually improve and handle problems in a manner that is similar to a human.

Infinite Complex views their investment into developing **AI Platforms** to be the next step in escalating their impact on providing new elements to improve life at the same time as increasing value and **ROI** for investors.
